**Abstract** The purpose of this study was to determine the effect of a 12-week, low-intensity, low-impact, and low-volume exercise program on the physical fitness of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were randomly assigned to either an exercise group or a control group. The exercise group performed a 12-week, low-intensity, low-impact, and low-volume exercise program. The control group did not exercise. The subjects were assessed for physical fitness at baseline and at 12 weeks. The results of the study showed that the exercise group had significantly higher levels of physical fitness than the control group at 12 weeks. The exercise program was effective in improving physical fitness in sedentary, middle-aged women.
