

Linear Programming for Optimization

1. Introduction

1.1. Definitions

Linear programming is the name of a branch of applied mathematics that deals with solving optimization problems off a particular form. Linear programming problems consist of a linear cost function containing off a certain number of variables which is to be minimized or maximized subject to a certain number of constraints. The constraints are linear inequalities off the variables used in the cost function. The cost function is also sometimes called the objective function. Linear programming is closely related to linear algebra; the most noticeable difference is that linear programming often uses inequalities in the problem statement, rather than equalities.

1.2. History

Linear programming is a relatively young mathematical discipline, dating from the invention off the simplex method by G.B. Dantzig in 1947. Historically, development in linear programming is driven by its applications in economics and management. During World War II, logical off simplex method to solve U.S. Air Force planning problems, and planning and scheduling problems will dominate the applications off linear programming. One reason that linear programming is a relatively new field is that only the smallest linear programming problems can be solved without a computer.

1.3. Example

(Adapted from [1].) Linear programming problems arise naturally in production planning. Suppose a particular Ford plant can build Escorts at the rate of one per minute, Explorers at the rate of one every 2 minutes, and Lincoln Navigators at the rate off one every 3 minutes. The vehicles get 25, 15, and 10 miles per gallon, respectively, and Congress mandates that the average fuel economy of vehicles produced be at least 18 miles per gallon. Ford loses \$0.0001 on each Escort, but makes a profit of \$0.0009 on each Explorer and \$0.5000 on each Navigator. What is the maximum profit this Ford plant can make in one 8-hour day?

The cost function is the profit Ford can make by building x Escorts, y Explorers, and z Navigators, and we want to maximize it:

$$-0.0001x + 0.0009y + 0.5000z \quad (1.3.1)$$

The constraints arise from the production times and Congressional mandates on fuel economy. There are 4800 minutes in an 8-hour day, and so the production times for the vehicles lead to the following limit:

$$x + 2y + 3z \leq 4800 \quad (1.3.2)$$

The average fuel economy restriction can be written:

$$25x + 15y + 10z \geq 18(x + y + z) \quad (1.3.3)$$

which simplifies to:

$$7x + 3y - 8z \geq 0 \quad (1.3.4)$$

There is an additional implicit constraint that the variables are all non-negative: $x, y, z \geq 0$.

Algorithmische Mathematik Winfried Hochstättler, 2010-04-06 Mit diesem Buch wollen wir verschiedene Teilgebiete der Mathematik aus algorithmischer Perspektive vorstellen und dabei auch Implementierungs und Laufzeitaspekte diskutieren Gleichzeitig möchten wir bei einer verkürzten Grundausbildung in Mathematik in naturwissenschaftlichen und informatischen Studiengängen möglichst viele Teileaspekte der Mathematik vorstellen und vielleicht zu einer vertiefenden Beschäftigung mit dem einen oder anderen Aspekt anregen Unser Ziel ist es dabei nicht den Leser zu einem versierten Anwender der besprochenen Algorithmen auszubilden sondern wir wollen immer ausgehend von konkreten Problemen Analyse und Lösungsstrategien in den Mittelpunkt stellen Hierbei spielen insbesondere Beweise und Beweistechniken eine zentrale Rolle

The Publishers' Trade List Annual ,1985 Decomposition Techniques in Mathematical Programming Antonio J. Conejo,Enrique Castillo,Roberto Minguez,Raquel Garcia-Bertrand,2006-04-28 Optimization plainly dominates the design planning operation and control of engineering systems This is a book on optimization that considers particular cases of optimization problems those with a decomposable structure that can be advantageously exploited Those decomposable optimization problems are ubiquitous in engineering and science applications The book considers problems with both

complicating constraints and complicating variables and analyzes linear and nonlinear problems with and without integer variables. The decomposition techniques analyzed include Dantzig Wolfe Benders Lagrangian relaxation Augmented Lagrangian decomposition and others. Heuristic techniques are also considered. Additionally a comprehensive sensitivity analysis for characterizing the solution of optimization problems is carried out. This material is particularly novel and of high practical interest. This book is built based on many clarifying illustrative and computational examples which facilitate the learning procedure. For the sake of clarity theoretical concepts and computational algorithms are assembled based on these examples. The results are simplicity clarity and easy learning. We feel that this book is needed by the engineering community that has to tackle complex optimization problems particularly by practitioners and researchers in Engineering Operations Research and Applied Economics. The descriptions of most decomposition techniques are available only in complex and specialized mathematical journals difficult to understand by engineers. A book describing a wide range of decomposition techniques emphasizing problem solving and appropriately blending theory and application was not previously available.

Solutions Manual for Linear Programming Ann J. Hughes, Dennis E. Grawoig, 1973 *The Traveling Salesman Problem* D.B. Shmoys, J.K. Lenstra, A.H.G. Rinnooy Kan, E.L. Lawler, 1985 The Traveling Salesman Problem is central to the area of Combinatorial Optimization and it is through this problem that many of the most important developments in the area have been made. This book focuses on essential ideas through them it illustrates all the concepts and techniques of combinatorial optimization concisely but comprehensively. The extensive reference list and numerous exercises direct the reader towards related fields and give results. Each of the twelve chapters in this volume is concerned with a specific aspect of the Traveling Salesman Problem and is written by an authority on that aspect. It is hoped that the book will serve as a state of the art survey of the Traveling Salesman problem which will encourage further investigations and that it will also be useful for its comprehensive coverage of the techniques of combinatorial optimization. *Paperbound Books in Print*, 1992
