Field Mouse Dissection

The field mouse is a small mammal that has many anatomical structures that are similar to human structures, however much smaller! Because the mouse is a mammal like humans, it is warm blooded and has a four-chambered heart. It is also a vertebrate animal, like humans, frogs, and fish, and therefore has a spinal cord connected to its brain. In this lab, you will observe both the external and internal anatomy of a field mouse to observe the best representation of human anatomy.

Day 1: External Anatomy and Muscular System

1. Obtain your mouse. Observe the following anatomical regions: the ventral side (belly), the dorsal side (back), the cranial region (head), pectoral region (area where front legs attach), thoracic region (chest area), abdominal region (belly area), pelvic region (area where the back legs attach), tail (...the tail...obviously). Label the regions and areas on the two diagrams below.

2. Make the following external anatomy observations. Then label them on the diagram on the next page.
 - a. The mouse has a fur (a mammalian trait) and has sensory hairs (whiskers) located on the face. These are called vibrissae.
 - b. The ears are composed of the external part, called the pinna, and the auditory meatus, the ear canal.
 - c. Observe the eye of your mouse. Mice and other rodents have large pupils causing their eyes to appear black. Locate the nictitating membrane found at the inside corner of the eye. Like the frog, this membrane can be drawn across the eye for protection, however the frog's nictitating membrane is much thicker and more obvious than the mouse's.
 - d. Next sex your mouse. First locate the anus on the ventral side of the mouse near the base of the tail. Determine if testes (male gonads) are present. If yes, then your mouse is male; if no, then your mouse is most likely female.
