SEEDS are known to contain low molecular weight polyphenols, tannins, lignin, lignans, and lignocellulose, which may contribute to their antioxidant properties.

As mentioned above, the most important consideration is to choose the right type of plant, and the best time to plant it. For example, most vegetables require a certain amount of time to grow, so it's best to plant them in the spring or summer. Some plants, like carrots and radishes, can be harvested quickly, so they can be planted earlier in the year.

- **positive feedback**: the level of expression of a transcription factor increases over time, it activates its own gene
- **negative feedback**: the level of expression of a transcription factor decreases over time, it inhibits its own gene
- **oscillating gene expression**: gene expression oscillates between high and low levels

For these, we present a new, more refined approach to the study of epigenetic control of gene expression. This approach is based on the use of a novel, high-throughput sequencing technique, called ChIP-seq, which allows for the identification of the genomic locations of specific proteins, such as transcription factors, that are bound to DNA. ChIP-seq is a powerful tool for understanding the complex regulatory mechanisms that control gene expression in various biological contexts.
