Methodology - Enabling Requirements-driven Design Spaces Victor Gane, 2011 During the conceptual design process the
 building shape orientation materials and other major properties are established all of which have a substantial impact on
 multi aspect performance In this process multidisciplinary teams define project objectives create various alternatives and try
 to understand their impacts and value With non parametric Computer Aided Design CAD methods designers produce and
 analyze as few as three alternatives whereas with parametric CAD they can generate thousands However with current
 parametric methods CAD experts lack a comprehensive method to build and analyze multi objective parametric models
 Therefore the resulting models do not effectively encapsulate multi objective value measures This research introduces the
 Design Scenarios Methodology DS which builds on research from Systems Engineering Process Modeling and Parametric
 Modeling With DS Enablers use Methods to create Elements using five interconnected models to define 1 project
 stakeholders and their objectives 2 designer logic used to address objectives 3 the connection between designer logic and
 computable models to generate alternatives 4 the predicted impact and 5 value of the generated alternatives I implemented
 DS as a web based software prototype and tested it on an industry project The results provide evidence that the DS method
 provides CAD experts with well defined logic and parameters for addressing objectives and the process enables creating
 parametric alternatives with clear multi objective values that potentially provide clients with better building designs This
 thesis lays the foundation for future research on automating the design alternative generation and analyses processes by
 leveraging such well established methods as Multi Disciplinary Optimization *Generative Modeling for Computer Graphics*
