Decision making to achieve a balance between the economic goals of producers and environmental quality benefits is
complex Most of the time we consider that the balance is skewed to one side or the other and that there are winners and
losers From the production perspective the loser is the economic return in exchange for environmental quality while from the
environmental perspective the loser is the environment at the expense of agricultural production and increased inputs In
reality there are opportunities within agriculture for a win win situation however to explore the endless possibilities that
constitute acceptable solutions is extremely difficult Over the past few years there has been an increasing development of
decision support tools that provide a framework that could be applied to agriculture As I have worked with producers
extensively over the past few years it has become apparent that we could provide more information to the American producer
that would help them evaluate different scenarios in their farming systems and evaluate potential alternatives through a
combination of simulation tools and decision support systems These are easy concepts to suggest but more difficult to
implement As an effort to expand our understanding of the potential of decision support tools for economic and
environmental balance a proposal was made to the Organisation for Economic Co operation and Development OECD in two

theme areas The outcome yielded an international workshop that assembled an international group of experts in decision support systems simulation models and agricultural production through industry consultants and producers This group also addressed enhancing environmental quality in agricultural systems Jerry L Hatfield from Preface
