**Comprehensive Geriatric Assessment** Alberto Pilotto, Finbarr C. Martin, 2017-12-29 This book offers an up to date review on the principles and practice of multidimensional assessment and management of the older individual which represents the cornerstone of modern clinical practice in the elderly The early chapters cover the main elements and scope of the comprehensive geriatric approach and explain the pathways of care from screening and case finding through to in depth assessment and treatment planning Subsequent chapters review the evidence of how best to apply the multidimensional assessment and management approach in defined healthcare settings and within specific clinical areas such as cancer and surgery Finally the education and training challenges are reviewed and the prospects for future clinical service and research in this important field are examined The book is very timely given the recent advances in application of this approach which reflect the growing international realization that older people are core business in many clinical areas where the role of specialist geriatric medicine has hitherto been limited Accordingly the book will be relevant to a wide range of clinicians The authorship comprises many of the best known and widely published experts in their respective fields

**Behavioral and Medical Comorbidity: Identifying Challenges and Transforming Systems of Care** M. Barton Laws, Brandon Gaudiano, Ronald Seifer, 2025-08-21 Prevalence of medical comorbidity is much higher for people with serious mental illness than it is for the general population People with mental illness die 14 to 18 years prematurely largely due to common causes of death including cerebrovascular disease diabetes and cancer For instance behavioral health disorders are the leading cause of disease burden in the U S There has

been a historic separation between the systems which address behavioral health and the medical care system which addresses other health issues. These systems differ in organization and financing and are represented by separate institutions and different professions. In addition, behavioral disorders are frequently criminalized rather than receiving treatment; sufferers are incarcerated. Effective medical management, social support, and patient experience are greatly enhanced when behavioral health, primary care, and other medical services are integrated with the healthcare system in the U.S., for example, which is just beginning to make progress toward this goal.

### **Clinical Psychometrics: Old Issues and New Perspectives**

Michela Balsamo, Marco Innamorati, Dorian A. Lamis, 2019-09-20. Clinical Psychometrics can be defined as a discipline that deals with the definition and measurement of clinical constructs. Among its interests, it includes dimensions such as skills, behavior, psychopathology, quality of life, and personality. Indeed, this discipline focuses on individual differences, the theory of measurement, the construction of measure instruments, and their application in an international context. Clinical Psychometrics can be considered as an essential tool in many fields of research related to psychological and psychiatric interventions; for example, it is useful for diagnostic assessment in various fields, including clinical and forensic areas, for the design and evaluation of specific psychological and pharmacological treatments. Therefore, Clinical Psychometrics is an applied discipline using psychometric tools to develop evidence-based type procedures relating to the understanding and improvement of the psychological conditions of individuals. This Research Topic on Clinical Psychometrics is interested in several aspects of measurement of psychological variables, focusing on the two fundamental paradigmatic aspects of the discipline: the Classical Test Theory and the Item Response Theory. This Research Topic seeks to stimulate a scientific debate between psychotherapists and psychometricians in this area. It could have applicative fallouts such as designing transcultural studies in order to: 1) investigate the invariance of new instruments for measuring clinical variables; 2) test the invariance of existing instruments used in clinical research; 3) develop more refined measure instruments for the evaluation of clinical dimensions, similarly to work conducted by the Obsessive Compulsive Cognitions Working Group in identifying domains considered central to OCD and developing the 87-item Obsessive Beliefs Questionnaire; 4) evaluate therapeutic outcomes and processes such as states, stress, psychological distress, psychological adjustment to illness, health-related quality of life, mood disorders, sexual functioning, etc. The goal of this Research Topic is to disseminate a culture of integration between psychometric model and clinical model, promoting the scientific debate about the deepening of the existing methods and/or the proposal of new methods capable of combining clinical significance with quantitative rigor. This Research Topic welcomed all types of articles, with the exception of case reports. We were particularly interested in: 1) Systematic reviews shedding new lights on the psychometric properties of the most used psychological measures in clinical psychology, neuroscience, psychiatry, psychosomatics, etc.; 2) Guidelines and suggestions on the correct use and gold standards in psychological assessment in the form of research studies and brief reports on the development of new measures and
