

A better method is the second alternative, **preemptive multitasking**, illustrated in Figure 1-10. Modern operating systems developed since the early 2000s use preemptive multitasking. These systems include all Windows OSs since Windows XP, along with Mac OS X and all Linux/UNIX variations. In preemptive multitasking, the operating system is in control of the computer at all times. It lets programs execute a little bit of code at a time, but immediately after the code executes, it forces the program to relinquish control of the CPU back to the operating system. It then takes the next program and repeats the same process. Because the operating system is in charge, it has a lot of control over how much of the computer's resources are allocated to each program. As a result, the computer must use more of its processor power and memory to support the operating system, but the behavior of programs and the computer as a whole are a little more predictable. Playing Solitaire while printing a word-processing file within a preemptive multitasking system is not a problem—both processes get enough CPU time to do their jobs—and the user is often unaware that the system has been rapidly switching between tasks.

Linux/UNIX OSs have always included preemptive multitasking since the original UNIX developed by Bell Labs in the 1970s.

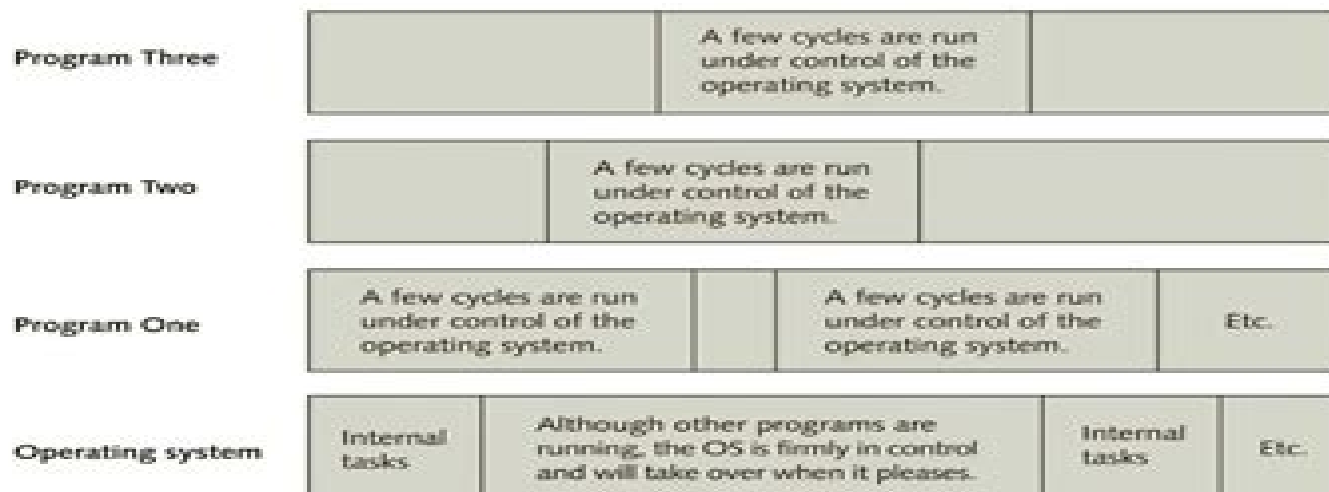

Figure 1-10 Preemptive multitasking basics

Some older operating systems, such as MS-DOS, were single-tasking operating systems. A single-tasking operating system executes one program at a time (see Figure 1-11). To do something else, one program must be stopped and a new program must be loaded and executed. Because multiple programs are not trying to use the same resources, single-tasking operating systems are a lot simpler. These systems, however, are considered older technology, and as new operating systems are released, they are seldom single-tasking. New single-tasking
