Line Distance Protection Guide:

Planning Guide for Power Distribution Plants Hartmut Kian, Wolfgang Fruth, 2012-01-27 When planning an industrial power supply plant the specific requirements of the individual production process are decisive for the design and mode of operation of the network and for the selection and design and ratings of the operational equipment. Since the actual technical risks are often hidden in the profound and complex planning task planning decisions should be taken after responsible and careful consideration because of their deep effects on supply quality and energy efficiency. This book is intended for engineers and technicians of the energy industry industrial companies and planning departments. It provides basic technical network and plant knowledge on planning installation and operation of reliable and economic industrial networks. In addition it facilitates training for students and graduates in this field. In an easy and comprehensible way this book informs about solution competency gained in many years of experience. Moreover it also offers planning recommendations and knowledge on standards and specifications the use of which ensures that technical risks are avoided and that production and industrial processes can be carried out efficiently reliably and with the highest quality.

Electrical Power System Protection C.

Christopoulos, A. Wright, 1999-06-30 The death of Professor Arthur Wright in the summer of 1996 deprived me of a friend and a colleague whose judgement and experience shaped this book. I pay tribute to his contributions to protection and electrical engineering education. In the five years since the first edition appeared many developments have taken place and it is now necessary to update the book. The use of digital communications and advanced signal processing techniques is now widespread and several fully numeric relays are available from manufacturers. Two new Chapters 13 and 14 have been added to introduce readers to these concepts and associated techniques. Artificial intelligence is making its impact in all engineering applications and power system protection is no exception. Expert systems fuzzy logic artificial neural networks adaptive and integrated protection synchronized measurements using the global positioning system genetic algorithms flexible a c transmission systems are some of the techniques considered in connection with protection. Although many of these techniques have not yet found major application in protection it is nevertheless essential for the educated protection engineer to have a basic understanding of the underlying principles and methodology so that he or she can evaluate their suitability for new relaying problems and applications. Chapter 15 was therefore added to guide readers through this developing area. I have also added some new material in other chapters to reflect changes over the past years.
