### **Research Directions in Parallel Functional Programming**

Kevin Hammond, Greg Michaelson, 2012-12-06

Programming is hard. Building a large program is like constructing a steam locomotive through a hole the size of a postage stamp. An artefact that is the fruit of hundreds of person years is only ever seen by anyone through a 100 line window. In some ways it is astonishing that such large systems work at all. But parallel programming is much much harder. There are so many more things to go wrong. Debugging is a nightmare. A bug that shows up on one run may never happen when you are looking for it but unfailingly returns as soon as your attention moves elsewhere. A large fraction of the program's code can be made up of marshalling and coordination algorithms. The core application can easily be obscured by a maze of plumbing. Functional programming is a radical, elegant, high level attack on the programming problem. Radical because it dramatically eschews side effects. Elegant because of its close connection with mathematics. High level because you can say a lot in one line. But functional programming is definitely not yet mainstream. That's the trouble with radical approaches: it's hard for them to break through and become mainstream. But that doesn't make functional programming any less fun and it has turned out to be a wonderful laboratory for rich type systems, automatic garbage collection, object models,

and other stuff that has made the jump into the mainstream

**Linear & Circular interpolations for a workpiece** Roland Nathan Kalonji,2018-03-20 Research Paper postgraduate from the year 2017 in the subject Engineering Mechanical Engineering University of the Witwatersrand language English abstract A combined 3D linear and circular interpolation principle is developed on the basis of the 3D linear and circular interpolation

principles The task was to choose and design a creative item to be machined using CNC machining which then required to write a code using CNC language Prior to the machining process we did a Computer Aided Design CAD drawing of the workpiece The drawing was further modified with the final model drawn using Auto Desk Inventor We used foam for our model and a 31 diameter end mill tool The main problem that was experienced was the cutting time the model took longer to be complete The cutting time was affected by the complexity of the design chosen tool size and the cutting technique Besides we learnt from the demonstration that the shorter the constructed code the more robust it is using a bigger tool is more efficient in terms of saving energy and time and that if the code is correct the CNC machine model becomes identical to that of the product Design
